

Aviation

Description

Aviation

Within Aviation, professional wireless communication systems are found in every area of the industry: aircraft communications, navigation, security, and airfield handling.

A typical airport has a diverse and complex communications infrastructure to serve the needs of many demanding and critical operations. Ground-to-air communications must be rock solid under any condition. Ground handling crews can only operate efficiently when radio communication is up and running. On top of this, airport security and emergency communication must never fail in critical situations.
